Tamman Technologies

Code Test

Overview

At Tamman, we supply quality code at a rapid pace. As the next step in our application process, we are supplying you with a wireframe of a landing page and asking you to build it.

Goals

1. **You must use the following tech stack:** We use semantic HTML5, CSS3 (SASS), JavaScript (ES6), along with Node and NPM as our code development. On top of that, we are using ReactJS to build components for reuse and rapid development. You must use the 'create-react-app' utility to start the project. You must also use React Components to build the landing page. All other choices, folder structure, additional plugins, styling, etc are up to you. Use best practices but you get to be creative here.

2. **The landing page must work:** It should be mobile responsive and also look good on a desktop. Once finished and code is submitted to us, we should be able to run 'npm start' and get a working page that is as close as possible to the wireframe we provided. You do not have to be pixel perfect. If a color is off by a few percent or if the alignment is a few pixels off it will not count against you.

The Challenge

You have 36 hours from the time this assignment was sent to you to return a ZIP file to the Google Drive Folder that we shared with you. Once you've completed the task, please email Wayne Renbjor at wrenbjor@tammatech.com, notifying him that it is complete.

During our face-to-face interview at Tamman, we will review your code and talk about how you chose to build the landing page.
